Error estimates

Abstract
In this paper we propose and analyze a temporally second-order accurate numerical scheme for the Cahn–Hilliard-Magnetohydrodynamics system of equations. The scheme is based on a modified Crank–Nicolson-type approximation for the time discretization and a mixed finite element method for the spatial discretization. The modified Crank–Nicolson approximation enables us to carry out the mass conservation and the energy stability analysis. Error estimates are derived for the phase field in the $L^1(0,T;H^1)$ norm, and for the velocity and the magnetic fields in the $L^1(0,T;L^2)$ norm, respectively. Numerical examples are presented to validate the theoretical results of the proposed scheme.

1. Introduction

In this paper, we consider a two-phase incompressible fluid, where the phases interact through a magnetic field. The physical system is modeled by a diffuse interface framework and is formulated as follows [1]:

$$\partial_t \phi + \nabla \cdot (\phi \mathbf{u}) = \varepsilon \nabla \cdot (M(\phi) \nabla w),$$
$$\varepsilon^{-1} (\phi^3 - \phi) - \varepsilon \Delta \phi = w,$$
$$\rho (\partial_t \mathbf{u} + (\mathbf{u} \cdot \nabla) \mathbf{u}) - \nabla \cdot (\eta(\phi) \nabla w) + \nabla p + \lambda \phi \nabla w = \mu (\nabla \times \mathbf{B}) \times \mathbf{B},$$
$$\partial_t \mathbf{B} + \mu^{-1} \nabla \times (\sigma(\phi)^{-1} \nabla \times \mathbf{B}) - \nabla \times (\mathbf{u} \times \mathbf{B}) = 0,$$
$$\nabla \cdot \mathbf{u} = 0,$$
$$\nabla \cdot \mathbf{B} = 0,$$

over $\Omega \times [0,T]$, where $\Omega$ is a bounded and convex polyhedral domain in $\mathbb{R}^3$ (or polygonal domain in $\mathbb{R}^2$), and $T$ stands for the final time. The above system is known as the Cahn–Hilliard-Magnetohydrodynamic (CH-MHD) model. In the above equations, the unknown $\mathbf{u}$ denotes the velocity vector; $\mathbf{B}$, the magnetic field; $p$, the pressure; $\phi$, the phase field; and $w$, the chemical potential. The constant $\mu$ is the magnetic permeability, and $\varepsilon > 0$ represents the interfacial width between
two phases. The coefficient $\rho$ is a positive constant representing the fluid density, and we set it to be 1 for brevity. The parameters $\eta(\phi)$ and $\sigma(\phi)$ stand for the hydrodynamic viscosity and electric conductivity, respectively, which are assumed to satisfy

$$0 < \eta := \min(\eta_1, \eta_2) \leq \eta(\phi) \leq \max(\eta_1, \eta_2) := \bar{\eta},$$

$$0 < \sigma := \min(\sigma_1, \sigma_2) \leq \sigma(\phi) \leq \max(\sigma_1, \sigma_2) := \bar{\sigma},$$

where $\eta_i$ and $\sigma_i$ ($i = 1, 2$) denote the viscosity and electric conductivity of the pure phase fluid $i$. It is assumed that $\eta(\phi)$ and $\sigma(\phi)^{-1}$ are Lipschitz continuous functions with respect to $\phi$. Specific expressions of functions $\eta(\phi)$ and $\sigma(\phi)$ can be found in [1]. For the sake of simplicity, we assume $\eta(\phi) \equiv \eta$ and $\sigma(\phi) \equiv \bar{\sigma}$ in this paper, where $\eta$ and $\sigma$ are positive constants, for the sake of simplicity. Furthermore, the mobility function $M(\phi)$ is set to be 1. The term $\lambda\phi\nabla w$ represents the continuum surface tension force with $\lambda$ being a positive constant $[2,3].$

With the assumptions mentioned above, we can simplify the system (1)-(5) as

$$\partial_t \phi + \nabla \cdot (\phi \mathbf{u}) = \varepsilon \Delta w,$$  

$$\varepsilon^{-1}(\mathbf{u}^i - \phi) - \varepsilon \Delta \phi = w, $$

$$\partial_t \mathbf{u} + (\mathbf{u} \cdot \nabla)\mathbf{u} - \eta \Delta \mathbf{u} + \nabla p + \lambda \phi \nabla w = \mu(\nabla \times \mathbf{B}) \times \mathbf{B}, $$

$$\mu \partial_t \mathbf{B} + \sigma^{-1} \nabla \times (\nabla \times \mathbf{B}) - \mu \nabla \times (\mathbf{u} \times \mathbf{B}) = 0, $$

$$\nabla \cdot \mathbf{u} = 0.$$  

The following boundary and initial conditions are used:

$$\frac{\partial \phi}{\partial \mathbf{n}} = \frac{\partial w}{\partial \mathbf{n}} = 0, \quad \mathbf{u} = 0, \quad \mathbf{B} \times \mathbf{n} = 0, \quad \text{on} \quad \partial \Omega \times [0, T],$$

$$\phi|_{t=0} = \phi_0, \quad w|_{t=0} = w_0, \quad \mathbf{u}|_{t=0} = \mathbf{u}_0, \quad \mathbf{B}|_{t=0} = \mathbf{B}_0, \quad \text{in} \quad \Omega, $$

where $\mathbf{n}$ denotes the outward unit normal vector on $\partial \Omega$. It is supposed that the initial condition $\nabla \cdot \mathbf{B}_0 = 0$, which implies $\nabla \cdot \mathbf{B}(\cdot, t) = 0$ for any $t > 0$.

In [1], Yang et al. proved the existence of weak solutions for the two-phase MHD system (1)-(5), and designed a first-order accurate numerical scheme with mass-conservation, unique solvability, and unconditional energy stability. An abstract convergence result was also established. In [4], second-order linear schemes were proposed for solving the CH–MHD equations, based on the second-order backward differential formulation (BDF2) and Crank–Nicolson methods. In [5], Zhao et al. proposed and analyzed a linearized Crank–Nicolson scheme for the system (1)-(5), where the SAV method was used to deal with the nonlinear term in the Cahn–Hilliard equation. In [6], Su et al. proposed an efficient scheme to solve the CH–MHD model, where the IEQ method and projection method were applied to approximate the phase field equations and the MHD equations, respectively. The unconditional energy stabilities of the semi- and full-discrete schemes were also proved in [6]. In these previous works, error estimates of the fully discrete numerical schemes have not been available for the CH–MHD model.

The system (6)-(10) contains a challenging part, the incompressible MHD system, which describes the interaction between the fluid and the magnetic fields. This part has been widely applied in the engineering modeling, such as the plasma motion and the liquid-metal processing [7,8]. The incompressible MHD model is formulated as [9]

$$\mu \partial_t \mathbf{B} + \sigma^{-1} \nabla \times (\nabla \times \mathbf{B}) - \mu \nabla \times (\mathbf{u} \times \mathbf{B}) = 0, $$

$$\rho(\partial_t \mathbf{u} + \mathbf{u} \cdot \nabla \mathbf{u}) - \Delta \mathbf{u} + \nabla p - \mu(\nabla \times \mathbf{B}) \times \mathbf{B} = 0, $$

$$\nabla \cdot \mathbf{u} = 0.$$  

There have been extensive works on regularity analysis for the continuous MHD system (13)-(15) [10–14]. In terms of numerical simulations, the $H^1(\Omega)$-conforming finite element methods (FEMs) have been widely adopted to approximate this system. Here, $d = 2, 3$, denotes the dimension of the domain. In [15], Gunzburger, Meir, and Peterson designed a numerical scheme based on $H^1(\Omega)$-conforming FEMs for the stationary MHD system. In [16], He proposed a first-order Euler semi-implicit scheme for solving the time-dependent MHD model, where the $H^1(\Omega)$-conforming FEM was used to approximate the magnetic field, and the convergence analysis of the scheme was considered. More developments on the $H^1(\Omega)$-conforming FEMs could be found in [17–22]. For the time-dependent MHD system, many existing works are dedicated to the study of temporally first-order accurate schemes, such as [16,23–25]. Recently, higher-order accurate temporal schemes have also attracted interest, in particular, BDF2-based methods in [26–28], and Crank–Nicolson-based methods in [29,30].

In addition to the fluid motion and the magnetic field evolution processes, another key feature in the physical system (6)-(10) is phase transition. The Allen–Cahn (AC) [31] and the Cahn–Hilliard (CH) [32] equations are fundamental gradient flow models in the description of the phase transition. Many numerical works have been reported [33–35], and the corresponding energy stability results have been proved. Neglecting the effect of magnetic fields, a combination of a phase field model and the Navier–Stokes equation [36,37], namely the Cahn–Hilliard–Navier–Stokes (CHNS) equations,
has been proposed to describe some natural phenomena, such as two-phase flows with topological change, including pinch-off and droplet merging. Error estimates and energy stability analyses of various numerical methods for solving the CHNS system have been analyzed in [37–39]. In [37], Diegel et al. proposed a numerical scheme with finite element spatial discretization and a modified Crank–Nicolson method for the CHNS model and presented the analysis of unique solvability, mass conservation, unconditional energy stability, and error estimates. More related numerical works related to the models coupling with the phase fields can be found in [2,40–47] and the references therein.

In this paper we design a fully discrete numerical scheme, which combines the $H^1(\Omega)$-conforming FEM spatial discretization and a modified Crank–Nicolson temporal approximation, to solve the CH-MHD system (6)–(10). Precisely, a modified Crank–Nicolson discretization is applied to the nonlinear part associated with the double-well potential, which together with the Adams-Bashforth extrapolation to the concave term and a second-order convex splitting technique enables us to theoretically justify the unconditional energy stability of the numerical algorithm. Another modified Crank-Nicolson-type approximation is applied to the phase diffusion term. As a result, we can obtain the certain boundness of the numerical approximation for the phase field. With the above numerical design, we are able to prove the unique solvability, discrete mass conservation, unconditional energy stability, and error estimates for the proposed scheme.

This paper is organized as follows. In Section 2 we outline the variational formulation and derive the energy stability for the continuous system. The numerical scheme is constructed in Section 3, and the unique solvability, discrete mass-conservation, and energy stability of the scheme are established as well. The proof of error estimates is provided in Section 4. Several numerical examples and concluding remarks are presented in Sections 5 and 6, respectively.

2. Variational formulation and stability analysis

We adopt the conventional Sobolev spaces $W^{k,p}(\Omega)$, for $k \geq 0$ and $1 \leq p \leq \infty$, with the abbreviations $L^p(\Omega) = W^{0,p}(\Omega)$ and $H^1(\Omega) = W^{1,2}(\Omega)$, and define

$$H_0^1(\Omega) := \{ v \in H^1(\Omega) \mid v|_{\partial \Omega} = 0 \} , \quad L_0^2(\Omega) = \left\{ v \in L^2(\Omega) \mid \int_{\Omega} v \, dx = 0 \right\} .$$

The corresponding vector spaces are given by

$$L^1(\Omega) = [L^p(\Omega)]^d , \quad W^{k,p}(\Omega) = [W^{k,p}(\Omega)]^d ,$$

$$H_0^1(\Omega) = [H_0^1(\Omega)]^d , \quad H^1(\Omega) = \left\{ v \in H^1(\Omega) \mid v \times n|_{\partial \Omega} = 0 \right\} ,$$

where $d = 2, 3$ denotes the dimension of the domain $\Omega$. In addition, the $L^2$ inner product is denoted by $(\cdot, \cdot)$.

The exact solution $(\phi, w, u, B, p)$ of (6)–(10) satisfies the following weak formulation: for almost all $t \in [0, T],

\begin{equation}
(\partial_t \phi, \xi) - (\phi u, \nabla \xi) + \varepsilon (\nabla w, \nabla \xi) = 0, \tag{16}
\end{equation}

\begin{equation}
\varepsilon^{-1} (\phi^2 - \phi, \varphi) + \varepsilon (\nabla \phi, \nabla \varphi) = (w, \varphi), \tag{17}
\end{equation}

\begin{equation}
(\partial_t u, v) + b(u, u, v) + \eta (\nabla u, \nabla v) - (p, \nabla \cdot v) + \lambda (\phi \nabla w, v) = \mu ((\nabla \times B) \times B, v), \tag{18}
\end{equation}

\begin{equation}
\mu (\partial_t B, \tilde{I}) + \sigma^{-1} (\nabla \times B, \nabla \times I) - \mu (u \times B, \nabla \times I) = 0, \tag{19}
\end{equation}

\begin{equation}
(\nabla \cdot u, q) = 0, \tag{20}
\end{equation}

for any $(\xi, \varphi, v, I, q) \in (H^1(\Omega), H^1(\Omega), H_0^1(\Omega), H^1(\Omega), L^2(\Omega))$, where $b(\cdot, \cdot, \cdot)$ is defined by

$$b(u, v, w) = \frac{1}{2} \left[ (u \cdot \nabla v, w) - (u \cdot \nabla w, v) \right], \quad \forall u, v, w \in H_0^1(\Omega). \tag{21}
$$

Clearly, we have $b(u, v, v) = 0$ for any $u, v \in H_0^1(\Omega)$.

A substitution of $\xi = \lambda w, \varphi = \lambda \partial_t \phi, v = u, I = B$ and $q = p$ into (16)–(20) leads to

$$\frac{1}{2} \frac{d}{dt} \left( \|u\|_{L^2}^2 + \mu \|B\|_{L^2}^2 + \frac{\lambda}{2 \varepsilon} \|\phi^2 - 1\|_{L^2}^2 + \lambda \varepsilon \|\nabla \phi\|_{L^2}^2 \right)$$

$$+ \lambda \varepsilon \|\nabla w\|_{L^2}^2 + \eta \|\nabla u\|_{L^2}^2 + \sigma^{-1} \|\nabla \times B\|_{L^2}^2 = 0.
$$

Thus by removing the non-negative terms and defining the total free energy as

$$\Theta := \|u\|_{L^2}^2 + \mu \|B\|_{L^2}^2 + \frac{\lambda}{2 \varepsilon} \|\phi^2 - 1\|_{L^2}^2 + \lambda \varepsilon \|\nabla \phi\|_{L^2}^2 ,$$

which is composed of the phase field free energy, and the kinematic and magnetic free energies, we get

$$\frac{d \Theta}{dt} \leq 0. \tag{22}
$$

This gives the total free energy dissipation for the two-phase MHD model (6)–(10).
3. Numerical method and main results

In this section, we will present a second-order Crank–Nicolson finite element scheme for solving the system (6)–(10). The unique solvability, mass conservation, and unconditional energy stability of the scheme will be established as well.

3.1. Fully discrete numerical scheme and main results

Let \( \mathcal{T}_h \) be a quasi-uniform partition of \( \Omega \) into tetrahedrons \( K_j \) in \( \mathbb{R}^3 \) (or triangles in \( \mathbb{R}^2 \), \( j = 1, 2, \ldots, M \), with mesh size \( h = \max_{1 \leq j \leq M} \text{diam}(K_j) \)). To solve for the unknowns \( \phi \) and \( u \), the following finite element space is employed:

\[
Y_h = \left\{ v_h \in H^1(\Omega) \mid v_h|_{K_j} \in P_1(K_j) \right\},
\]

for any integer \( r \geq 2 \), where \( P_r(K_j) \) stands for the space of polynomials with degree at most \( r \) in \( K_j \). The Taylor–Hood elements are utilized to approximate \( u \) and \( p \), and the corresponding finite element spaces are defined by

\[
X_h = \left\{ v_h \in H^1(\Omega) \mid v_h|_{K_j} \in P_1(K_j) \right\},
\]

\[
M_h = \left\{ v_h \in L_0^2(\Omega) \mid v_h|_{K_j} \in P_{r-1}(K_j) \right\},
\]

with \( P_r(K_j) = \{ P_r(K_j) \}_{K_j} \). Moreover, the following finite element space is introduced for solving \( B \):

\[
S_h = \left\{ v_h \in H^1(\Omega) \mid v_h|_{K_j} \in P_1(K_j) \right\}.
\]

Let \( \{ t_n \}_{n=0}^{N-1} = \tau \{ 0, T \} \) with the time step size \( \tau = T/N \). We denote by \( u^n \) the abbreviation for \( u(\cdot, t^n) \), and then define

\[
\begin{align*}
\tilde{v}^{n+\frac{1}{2}} &= \frac{1}{2}(3v^n - v^{n-1}), & \tilde{v}^{n+\frac{3}{2}} &= \frac{1}{2}(v^{n+1} + v^n), \\
\hat{v}^{n+1} &= \frac{1}{4}(3v^{n+1} + v^n), & \hat{v}^{n+2} &= \frac{1}{4}(v^{n+1} - v^n),
\end{align*}
\]

Based on finite element spatial approximation and a modified Crank–Nicolson temporal discretization, we propose a fully discrete scheme for solving the incompressible Cahn–Hilliard-MHD system (6)–(10): find \( (\phi_h^{n+1}, u_h^{n+1}, B_h^{n+1}, p_h^{n+1}) \in (Y_h, X_h, S_h, M_h) \), such that

\[
\begin{align*}
\left( \partial_t \phi_h^{n+\frac{1}{2}}, \xi_h \right) - \left( \phi_h^{n+\frac{1}{2}}, \nabla \xi_h \right) + \nu \left( \nabla \phi_h^{n+\frac{1}{2}}, \nabla \xi_h \right) &= 0, \\
\nu^{-1} \left( \phi_h^{n+\frac{1}{2}} \phi_h^{n+\frac{1}{2}} \right)^2 - \nu^{-1} \left( \phi_h^{n+\frac{1}{2}} \phi_h^{n+\frac{1}{2}} \right)^2 + \nu \left( \nabla \phi_h^{n+\frac{1}{2}}, \phi_h^{n+\frac{1}{2}} \right) &= \left( \hat{u}^{n+\frac{1}{2}}, \phi_h^{n+\frac{1}{2}} \right), \\
\left( \partial_t u_h^{n+1}, v_h \right) + b(u_h^{n+\frac{1}{2}}, u_h^{n+\frac{1}{2}}, v_h) + \eta \left( \nabla u_h^{n+\frac{1}{2}}, \nabla v_h \right) - \left( \hat{p}^{n+1}, \nabla \cdot v_h \right) &+ \lambda \left( \nabla \phi_h^{n+\frac{1}{2}}, v_h \right) = \left( \nabla \times B_h^{n+\frac{1}{2}}, v_h \right), \\
\mu \left( \partial_t B_h^{n+\frac{1}{2}}, I_h \right) + \sigma^{-1} \left( \nabla \times B_h^{n+\frac{1}{2}}, \nabla \times I_h \right) &+ \sigma^{-1} \left( \nabla \cdot B_h^{n+\frac{1}{2}}, \nabla \cdot I_h \right) \\
- \mu \left( \hat{u}^{n+\frac{1}{2}} \times B_h^{n+\frac{1}{2}}, \nabla \times I_h \right) &= 0,
\end{align*}
\]

for any \( (\xi_h, \phi_h, v_h, u_h, I_h, q_h) \in (Y_h, X_h, S_h, M_h) \), and \( n = 1, 2, \ldots, N-1 \).

For the error estimates, we shall assume the following regularities of solutions:

\[
\begin{align*}
\phi &\in W^{1,\infty}(0, T; H^{r+1}(\Omega)) \cap H^2(0, T; H^3(\Omega)) \cap C^0(0, T; L^2(\Omega)), \\
\phi^2 &\in H^2(0, T; H^2(\Omega)), \\
w &\in L^\infty(0, T; H^{r+1}(\Omega)), \\
u &\in W^{1,\infty}(0, T; H^{r+1}(\Omega)) \cap H^2(0, T; H^3(\Omega)) \cap C^0(0, T; L^2(\Omega)), \\
B &\in W^{1,\infty}(0, T; H^{r+1}(\Omega)) \cap H^2(0, T; H^3(\Omega)) \cap C^0(0, T; L^2(\Omega)), \\
p &\in L^\infty(0, T; H^r(\Omega)) \cap L^2(\Omega),
\end{align*}
\]

where \( r \geq 2 \) is the spatial approximation order. Then, we have the following results of the numerical scheme (24)–(28).

**Theorem 3.1.** Assume that the solution \((\phi, w, u, B, p)\) of the CH-MHD system (6)–(10) is sufficiently smooth. Then, there exists a positive constant \( \tau_0 \) such that when \( \tau < \tau_0 \), the following error estimates could be established for the numerical
scheme (24)–(28):

\[
\max_{1 \leq n < N-1} \left\| \nabla \left( \phi_h^{n+1} - \phi_h^n + \mu \frac{B_h^{n+1} - B_h^n}{\tau} \right) \right\|_{L^2} + \left\| \mathbf{u}_h^{n+1} - \mathbf{u}_h^n \right\|_{L^2} + \left\| B_h^{n+1} - B_h^n \right\|_{L^2} \leq C_0(h^r + \tau^s),
\]

(29)

\[
\tau \sum_{n=1}^{N-1} \left( \| \nabla (\mathbf{u}_h^{n+\frac{1}{2}} - \mathbf{u}_h^n) \|_{L^2}^2 + \| \nabla \left( B_h^{n+\frac{1}{2}} - B_h^n \right) \|_{L^2}^2 \right) \leq C_0(h^r + \tau^s),
\]

(30)

where \(C_0\) is a positive constant independent of \(h\), \(\tau\), and \(n\).

The proof of Theorem 3.1 will be given in Section 4.

Remark 3.1. A stabilized term \(\sigma^{-1} (\nabla \cdot B_h^{n+\frac{1}{2}}, \nabla \cdot \mathbf{l}_t)\) has been added to ensure the coercivity of the magnetic equation, which will facilitate the analysis of unique solvability of Eq. (27).

Remark 3.2. In this paper, the Crank–Nicolson method enables us to obtain unconditional energy stability for the numerical scheme. It is straightforward to extend the Crank–Nicolson scheme to the case of nonuniform meshes and the corresponding theoretical analyses are similar. Note that a modified Crank–Nicolson approximation has been applied to the chemical potential associated with the double-well energy potential. The resulting nonlinear system could be solved using the discrete inf–sup condition. For the sake of brevity, we omit the proof and refer readers to \([48,49]\) and the references therein.

Remark 3.3. For the sake of brevity, we assume that the numerical solutions at the first time step are given and satisfy the estimates (29)–(30). One approach to constructing numerical schemes at the first time step is to use methods such as the Crank–Nicolson method or the backward Euler method with a very small time size. Then the resulting schemes satisfy the convergence in (29)–(30).

Remark 3.4. A temporal discretization \(\nabla \phi_h^{n+\frac{1}{2}} = \frac{1}{2} \nabla \phi_h^{n+1} + \frac{1}{4} \nabla \phi_h^{n-1}\), i.e., the modified Crank–Nicolson method, is used in (25) to ensure the bound of \(\| \phi_h^n \|_{L^\infty}\); see Lemma 4.4.

Remark 3.5. In this work, we focus on the error estimates of \(\mathbf{u}, \mathbf{B}, \phi, w\). The error estimate of \(p\) can be obtained by using the discrete inf–sup condition. For the sake of brevity, we omit the proof and refer readers to [50] for more details. Theoretical results in Theorem 3.1 show that the spatial convergence orders for \(\phi, w\), and \(\mathbf{u}\) are optimal in \(H^1\) semi-norm.

In this paper, we denote by \(C\) a generic positive constant which could vary at different places and by \(\xi\) a generic small positive constant, which are independent of \(n, h, \tau\), and \(C_0\).

3.2. Discrete mass conservation and unconditional energy stability

Theorem 3.2. The fully discrete FEM system (24)–(28) admits a unique solution, for any \(\tau > 0\) and \(h > 0\), and, in addition, the following discrete mass conservation is valid:

\[
\int_{\Omega} \phi_h^{n+1} dx = \int_{\Omega} \phi_h^n dx.
\]

(31)

for \(n = 1, 2, \ldots, N - 1\). Furthermore, the numerical solution \((\phi_h^n, w_h^{n-\frac{1}{2}}, \mathbf{u}_h^n, B_h^n, p_h^n)\) to the fully discrete scheme (24)–(28) satisfies the following discrete energy estimate:

\[
\Theta_h^{n+1} \leq \Theta_h^n,
\]

(32)

for any \(n = 1, 2, \ldots, N - 1\), where

\[
\Theta_h^n := \frac{\lambda}{2\tau^2} \left( \| (\phi_h^n)^2 - 1 \|_{L^2}^2 + \| \phi_h^n - \phi_h^{n-1} \|_{L^2}^2 \right) + \frac{1}{4} \| \nabla \phi_h^n \|_{L^2}^2 + \mu \| B_h^n \|_{L^2}^2,
\]

(33)

for any time step size \(\tau > 0\) and any space step size \(h > 0\).

Proof. Following similar arguments to those as given in [1, Theorem 4.5], we can get the unconditional unique solvability of solutions of system (24)–(28). We will suppress that argument for the sake of brevity.
To obtain the discrete mass conservation, we take $\xi_h = 1$ in (24) and get
\[
(\delta_t \phi_h^{n+\frac{1}{2}}, 1) = 0,
\]
which yields the discrete mass conservation equality (31).

Next we proceed with the proof of discrete energy stability. Taking $\xi_h = \lambda \phi_h^{n+\frac{1}{2}}$, $\psi_h = \lambda \delta_t \phi_h^{n+\frac{1}{2}}$, $v_h = \bar{u}_h^{n+\frac{1}{2}}$, $l_h = \bar{B}_h^{n+\frac{1}{2}}$, $q_h = \bar{p}_h^{n+\frac{1}{2}}$ in (24)–(28), respectively, and summing up the resulting equations lead to
\[
\begin{align*}
\lambda \varepsilon^{-1} & \left( \phi_h^{n+\frac{1}{2}} \delta_t \phi_h^{n+\frac{1}{2}} + (\phi_h^{n+1})^2 - \phi_h^{n+\frac{1}{2}} \phi_h^{n+\frac{1}{2}} \right) + \lambda \varepsilon (\nabla \phi_h^{n+\frac{1}{2}}, \nabla \delta_t \phi_h^{n+\frac{1}{2}}) \\
&+ \lambda \varepsilon \| \nabla w_h^{n+\frac{1}{2}} \|_{L_2}^2 + (\delta_t \bar{u}_h^{n+\frac{1}{2}}, \bar{u}_h^{n+\frac{1}{2}}) + \mu (\delta_t \bar{B}_h^{n+\frac{1}{2}}, \bar{B}_h^{n+\frac{1}{2}}) \\
&+ \eta \| \nabla \bar{u}_h^{n+\frac{1}{2}} \|_{L_2}^2 + \sigma^{-1} \| \nabla \times \bar{B}_h^{n+\frac{1}{2}} \|_{L_2}^2 + \sigma^{-1} \| \nabla \cdot \bar{B}_h^{n+\frac{1}{2}} \|_{L_2}^2 = 0.
\end{align*}
\]
(34)

With the help of the following identities
\[
\left( \frac{3}{4} a + \frac{1}{4} c \right) (a - b) = \frac{1}{2} (a^2 - b^2) + \frac{1}{8} [(a - b)^2 - (b - c)^2 + (a - 2b + c)^2],
\]
\[
\left( a + b a^2 + b^2 - \frac{3b - c}{2} \right) (a - b) = \frac{1}{4} (a^2 - 1)^2 - (b^2 - 1)^2 \\
+ (a - b)^2 - (b - c)^2 + (a - 2b + c)^2.
\]
(35)

The discrete energy stability (32) follows immediately for $n = 1, 2, \ldots, N - 1$.

Meanwhile, (35) also leads to the boundness of the numerical solution that
\[
\max_{2 \leq n \leq N} \left( \| \phi_h^n \|_{L_2} + \| \nabla \phi_h^n \|_{L_2} + \| u_h^n \|_{L_2} + \| B_h^n \|_{L_2} \right) \leq C.
\]
(36)

\[
\tau \sum_{n=1}^{N-1} \left( \| \nabla w_h^{n+\frac{1}{2}} \|_{L_2} + \| \nabla \bar{u}_h^{n+\frac{1}{2}} \|_{L_2} + \| \nabla \cdot \bar{B}_h^{n+\frac{1}{2}} \|_{L_2} + \| \nabla \times \bar{B}_h^{n+\frac{1}{2}} \|_{L_2} \right) \leq C,
\]
(37)

which will be used in the error estimates in the next section. \qed

4. Error estimates

In this section we carry out error estimates of the numerical scheme (24)–(28), as given by Theorem 3.1.

4.1. Some preliminary results

First of all, we introduce several projections and the corresponding consistency estimates. The Ritz projection $Q_h : H^1(\Omega) \rightarrow Y_h$ is defined by
\[
(\nabla (v - Q_h v), \nabla v_h) = 0, \quad v \in H^1(\Omega), \quad \forall v_h \in Y_h,
\]
with $\int_{\Omega} (v - Q_h v) dx = 0$. The Stokes projection $(R_h u, R_h p)$ of $(u, p) \in H^1_0(\Omega) \times L_2^2(\Omega)$ is defined by
\[
\eta (\nabla (u - R_h u), \nabla v_h) - (p - R_h p, \nabla \cdot v_h) = 0, \quad \forall v_h \in X_h,
\]
(39)
\[
(\nabla \cdot (u - R_h u), q_h) = 0, \quad \forall q_h \in M_h.
\]
(40)

Furthermore, $\Pi_h : H^1(\Omega) \rightarrow S_h$ denotes the Maxwell projection satisfying
\[
(\nabla \cdot (B - \Pi_h B), \nabla \times I_h) + (\nabla \cdot (B - \Pi_h B), \nabla \cdot I_h) = 0, \quad B \in \tilde{H}^1(\Omega), \quad \forall I_h \in S_h.
\]
(41)
In the following, we recall several existing results, which will be used frequently in the proof of Theorem 3.1.

**Lemma 4.1** ([51–53]). The following inequalities hold for the Ritz projection, Stokes projection, and Maxwell projection:
\[ \|v - Q_h v\|_{L^2} + h\|v - Q_h v\|_{H^1} \leq Ch^{r+1}\|v\|_{H^{r+1}}, \tag{42} \]
for \(0 \leq \ell \leq r,
\[ \|R_h u\|_{W^{1,4}} + \|R_h u\|_{L^\infty} \leq C(\|u\|_{H^2} + \|p\|_{H^1}), \tag{43} \]
\[ \|u - R_h u\|_{L^2} + h\|u - R_h u\|_{H^1} \leq Ch^{r+1}(\|u\|_{H^{r+1}} + \|p\|_{H^r}), \tag{44} \]
\[ \|p - R_h p\|_{L^2} \leq Ch^r(\|u\|_{H^{r+1}} + \|p\|_{H^r}). \tag{45} \]
for \(0 \leq \ell \leq r,
\[ \|B - I_h B\|_{L^2} + h\|B - I_h B\|_{H^1} \leq Ch^{r+1}\|B\|_{H^{r+1}}. \tag{46} \]
for \(0 \leq \ell \leq r,
where \(C\) is a positive constant independent of \(h\).

**Lemma 4.2** ([51]). For any \(v_h\) in the finite spaces \(Y_h, M_h, X_h,\) or \(S_h\), it holds that
\[ \|v_h\|_{W^{m,q}} \leq Ch^{n-m+\frac{d}{q} - \frac{r}{2}}\|v_h\|_{W^{m,q}}, \tag{47} \]
for \(0 \leq n \leq m \leq 1, 1 \leq q \leq s \leq \infty,\) where \(d\) is the dimension of the space, and \(C\) is a positive constant independent of \(h\).

Let \(\hat{Y}_h := Y_h \cap L^2_0(\Omega)\). We define a linear operator \(T_h : \hat{Y}_h \rightarrow \hat{Y}_h\) such that for given \(v_h \in \hat{Y}_h,
\[(\nabla T_h v_h, \nabla \xi_h) = (v_h, \xi_h), \quad \forall \xi_h \in \hat{Y}_h. \tag{48} \]
Then for \(v_h, \xi_h \in \hat{Y}_h,\) the discrete \(H^{-1}\) inner product is introduced as
\[(v_h, \xi_h)_{-1,h} := (T_h v_h, \xi_h). \tag{49} \]
It is known [36, Lemma 2.6] that \((\cdot, \cdot)_{-1,h}\) defines an inner product on \(\hat{Y}_h,\) and the induced negative norm is given by
\[ \|v_h\|_{-1,h} := \sqrt{(v_h, v_h)_{-1,h}}. \tag{50} \]
For the above negative norm, we have the following result.

**Lemma 4.3** ([36, Lemma 2.6]). For all \(\chi \in Y_h\) and all \(v_h \in \hat{Y}_h,\) it holds that
\[(v_h, \chi) \leq C\|v_h\|_{-1,h}\|\nabla \chi\|_{L^2}, \tag{51} \]
where \(C\) is a positive constant independent of \(h.\)

In the error estimates of the numerical scheme (24)–(28), the following lemma will be frequently used.

**Lemma 4.4.** The numerical solution \(\phi^n_h\) to the system (24)–(28) satisfies
\[ \|\phi^n_h\|_{L^\infty} + \|\nabla \phi^n_h\|_{L^2} \leq C(T + 1), \tag{52} \]
where \(C\) is a positive constant independent of \(h,\) \(\tau,\) and \(T\) (the final time).

**Proof.** We refer to Proposition 2.8, Lemma 2.10, and Lemma 2.13 in [37] for the proof of estimate (52). The details are basically the same. \(\Box\)

### 4.2. Error equations

With the projections defined in the previous subsection, we rewrite Eqs. (16)–(20) into the following form:
\[ (\delta, Q_h \phi^{n+\frac{1}{2}}, \xi_h) + \frac{\epsilon}{2}(\phi^{n+\frac{1}{2}}, \nabla \xi_h) = T_{\phi}(\xi_h), \tag{53} \]
\[ \epsilon^{-1}(\phi^{n+\frac{1}{2}} + \nabla \phi^{n+\frac{1}{2}}), \psi_h) - \epsilon^{-1}(Q_h \phi^{n+\frac{1}{2}}, \psi_h) + \epsilon(\nabla Q_h \phi^{n+\frac{1}{2}}, \nabla \psi_h) \]
\[ = (Q_h \phi^{n+\frac{1}{2}}, \psi_h) + T_{\psi}(\psi_h), \tag{54} \]
\[ (\delta, R_h \mu^{n+\frac{1}{2}} + (\mu^{n+\frac{1}{2}} - 2v_h + (\mu^{n+\frac{1}{2}} - ((R_h \mu^{n+\frac{1}{2}}, \nabla v_h) - (R_h \mu^{n+\frac{1}{2}}, \nabla \cdot v_h) \]
\[ + \lambda(\phi^{n+\frac{1}{2}} \nabla \mu^{n+\frac{1}{2}}, v_h)) = \mu((\nabla \phi^{n+\frac{1}{2}}) \times \phi^{n+\frac{1}{2}}), v_h) + T_{\mu}(v_h), \tag{55} \]
\[ \mu \left( \frac{\partial}{\partial t} \mathbf{B}^{n+\frac{1}{2}} \cdot \mathbf{B}^{n+\frac{1}{2}} \right) + \sigma^{-1} \left( \nabla \times \frac{\partial}{\partial t} \mathbf{B}^{n+\frac{1}{2}} \cdot \mathbf{v} \right) + \sigma^{-1} \left( \nabla \cdot \frac{\partial}{\partial t} \mathbf{B}^{n+\frac{1}{2}} \cdot \mathbf{v} \right) = 0, \]

(57)

for any \((\xi_h, \varphi_h, \mathbf{v}_h, I_h, q_h) \in \{Y_h, X_h, S_h, M_h\}\), and \(1 \leq n \leq N\). Here, the truncation error terms \(T_\varphi, T_v, T_u, T_B, T_p\) are given by

\[ T_\varphi(\xi_h) = \left( \delta_t \phi_n + \frac{1}{2} \left( \phi_n^{n+\frac{1}{2}} \right) \right) - \left( \phi_n^{n+\frac{1}{2}} - \phi_n^{n+\frac{1}{2}} - \nabla \cdot \mathbf{w}^{n+\frac{1}{2}} \right) \cdot \nabla \xi_h, \]

(56)

\[ T_v(\varphi_h) = \frac{\varepsilon}{2} \left( \nabla \cdot \left( \phi_n^{n+\frac{1}{2}} \right) \right) - \left( \phi_n^{n+\frac{1}{2}} - \phi_n^{n+\frac{1}{2}} , \varphi_h \right) \]

\[ + \varepsilon \left( \nabla \cdot \left( \phi_n^{n+\frac{1}{2}} - \phi_n^{n+\frac{1}{2}} , \varphi_h \right) + \left( \phi_n^{n+\frac{1}{2}} - \phi_n^{n+\frac{1}{2}} , \varphi_h \right) \right), \]

(57)

Now, we analyze the errors between the numerical solutions and the projection functions and thus define

\[ e^n_\varphi := Q_h \phi^n - \phi^n_h, \quad e^n_v := Q_h \mathbf{w}^n - \mathbf{w}^n_h, \]

\[ e^n_u := R_h \mathbf{u}^n - \mathbf{u}^n_h, \quad e^n_B := R_h B^n - B^n_h, \]

\[ e^n_p := R_h p^n - p^n_h. \]

Subtracting (24)–(28) from (53)–(57) yields a system of error evolutionary equations:

\[ \left( \delta_t e^n_\varphi , \xi_h \right) - \left( \phi_n^{n+\frac{1}{2}} - \phi_n^{n+\frac{1}{2}} , \nabla \xi_h \right) + \varepsilon \left( \nabla e^n_w , \nabla \xi_h \right) = T_\varphi(\xi_h), \]

(58)

\[ e^{-1} \left( \frac{2}{\varepsilon} \phi_n^{n+\frac{1}{2}} \right) + \left( \phi_n^{n+\frac{1}{2}} \right) - \left( \phi_n^{n+\frac{1}{2}} , \varphi_h \right) \]

\[ + \varepsilon \left( \nabla e^n_w , \varphi_h \right) = \left( \varepsilon_w^{n+\frac{1}{2}} , \varphi_h \right) + T_v(\varphi_h), \]

(59)

\[ \left( \delta_t e^n_v , \mathbf{v}_h \right) + \varepsilon \left( \nabla e^n_w , \mathbf{v}_h \right) - \left( \phi_n^{n+\frac{1}{2}} , \mathbf{v}_h \right) \]

\[ + \left( \phi_n^{n+\frac{1}{2}} , \varphi_h \right) = \left( \varepsilon_{e^n_v}^{n+\frac{1}{2}} , \mathbf{v}_h \right) + T_u(\mathbf{v}_h), \]

(60)

\[ \mu \left( \left( \frac{\partial}{\partial t} e^n_B , \mathbf{B}^{n+\frac{1}{2}} \cdot \mathbf{v} \right) + \sigma^{-1} \left( \nabla \cdot \left( \mathbf{B}^{n+\frac{1}{2}} \cdot \mathbf{v} \right) \right) \right) \]

\[ = \left( \phi_n^{n+\frac{1}{2}} , \mathbf{B}^{n+\frac{1}{2}} \cdot \mathbf{v} \right) + T_B(I_h), \]

(61)

\[ \left( \nabla \cdot e^n_B , q_h \right) = 0, \]

(62)

for any \((\xi_h, \varphi_h, \mathbf{v}_h, I_h, q_h) \in \{Y_h, X_h, S_h, M_h\}\), and \(n = 1, 2, \ldots, N - 1\). In the following subsection, we will analyze the above error equations and present the proof of Theorem 3.1.

4.3. Proof of Theorem 3.1

**Proof.** Step 1: Substituting \(\xi_h = e^n_\varphi^{n+\frac{1}{2}}\) in (58) and \(\varphi_h = \delta_t e^n_\varphi^{n+\frac{1}{2}}\) in (59) gives

\[ \frac{\varepsilon}{2} \left( \| \nabla e^n_\varphi^{n+\frac{1}{2}} \|_{L^2}^2 - \| \nabla e^n_\varphi^{n+\frac{1}{2}} \|_{L^2}^2 + e \| \nabla e^n_{w}^{n+\frac{1}{2}} \|_{L^2}^2 \right) \]

\[ + \left( \frac{\varepsilon}{2} \| \nabla e^n_{e^n_v}^{n+\frac{1}{2}} - e^n_v \|_{L^2}^2 \right) \]

\[ = -e^{-1} \left( \frac{\phi_n^{n+\frac{1}{2}}}{2} \frac{\left( \phi_n^{n+\frac{1}{2}} \right)^2}{\phi_n^{n+\frac{1}{2}}} + \left( \phi_n^{n+\frac{1}{2}} , \varphi_h \right) \right), \]

(63)

\[ + e^{-1} \left( \frac{\phi_n^{n+\frac{1}{2}}}{2} \frac{\left( \phi_n^{n+\frac{1}{2}} \right)^2}{\phi_n^{n+\frac{1}{2}}} , \delta_t e^n_\varphi^{n+\frac{1}{2}} \right) + e^{-1} \left( \frac{\phi_n^{n+\frac{1}{2}}}{2} , \delta_t e^n_\varphi^{n+\frac{1}{2}} \right) \]

8
Now, we estimate \( I_{1,i} \), \( i = 1, 2, \ldots, 5 \), respectively. By applying Lemma 4.4, it can be proved that [36, Lemma 3.6]

\[
I_{1,1} = -\frac{\varepsilon^{-1}}{4} \left[ \left( (\phi^{n+1})^3 - (\phi^{n+1})_b, \delta_i e_t^{n+\frac{1}{2}} + (\phi^{n+1})_b \right) + \left( (\phi^{n+1})^3 - (\phi^{n+1})_b, \delta_i e_t^{n+\frac{1}{2}} \right) \right] \\
\leq C \| \nabla (\phi^{n+1} - (\phi^{n+1})_b) \|_2^2 + C \| \nabla (\phi^n - (\phi^n)_b) \|_2^2 + \xi \| \delta_i e_t^{n+\frac{1}{2}} \|_{-1,h}^2
\]

where we have used (42) in the last inequality and \( \xi \) is a generic small positive constant independent of \( n, h, r \), and \( C_0 \).

By using (51), the analysis of \( I_{1,2} \) is straightforward:

\[
I_{1,2} = \varepsilon^{-1} (\phi^{n+\frac{1}{2}}, \delta_i e_t^{n+\frac{1}{2}}) \leq C \| \nabla e_t^{n+\frac{1}{2}} \|_2^2 + \xi \| \delta_i e_t^{n+\frac{1}{2}} \|_{-1,h}^2.
\]

To estimate \( I_{1,3} \), we define

\[
\frac{\varepsilon^{n+\frac{1}{2}}}{\varepsilon^{n+\frac{1}{2}}} := \left(\Omega^{-1}(\phi^{n+\frac{1}{2}}, 1)\right).
\]

Since

\[
\| \varepsilon^{n+\frac{1}{2}} - \frac{\varepsilon^{n+\frac{1}{2}}}{\varepsilon^{n+\frac{1}{2}}} \|_2 \leq C \| \nabla \left( \frac{\varepsilon^{n+\frac{1}{2}}}{\varepsilon^{n+\frac{1}{2}}} - \varepsilon^{n+\frac{1}{2}} \right) \|_2 = C \| \nabla \frac{\varepsilon^{n+\frac{1}{2}}}{\varepsilon^{n+\frac{1}{2}}} \|_2,
\]

we arrive at

\[
I_{1,3} = \left(\phi^{n+\frac{1}{2}} - \phi^{n+\frac{1}{2}}_b, \phi^{n+\frac{1}{2}}_b, \varepsilon^{n+\frac{1}{2}}, \varepsilon^{n+\frac{1}{2}} \right) + (\phi^{n+\frac{1}{2}}_b - \phi^{n+\frac{1}{2}}_b, \phi^{n+\frac{1}{2}}_b - \phi^{n+\frac{1}{2}}_b, \varepsilon^{n+\frac{1}{2}}, \varepsilon^{n+\frac{1}{2}}) \\
\leq C \| \phi^{n+\frac{1}{2}} - \phi^{n+\frac{1}{2}}_b \|_2 \| \varepsilon^{n+\frac{1}{2}} - \varepsilon^{n+\frac{1}{2}}_b \|_2 + \xi \| \delta_i e_t^{n+\frac{1}{2}} \|_{-1,h}^2.
\]

where we have used (42), (44), Lemma 4.4, and integration in parts in the second inequality. In view of the truncation error terms and using the mass conservation of \( \phi \), \( I_{1,4} \) can be bounded by

\[
I_{1,4} = \left(\delta_i Q^0 \phi^{n+\frac{1}{2}} - \phi^{n+\frac{1}{2}}, \phi^{n+\frac{1}{2}}_b, \varepsilon^{n+\frac{1}{2}} - \varepsilon^{n+\frac{1}{2}}_b \right) + (\delta_i Q^0 \phi^{n+\frac{1}{2}} - \phi^{n+\frac{1}{2}}, \phi^{n+\frac{1}{2}}_b, \varepsilon^{n+\frac{1}{2}} - \varepsilon^{n+\frac{1}{2}}_b) \\
\leq C \| Q^0 \delta_i \phi^{n+\frac{1}{2}} - \phi^{n+\frac{1}{2}} \|_2 \| \varepsilon^{n+\frac{1}{2}} - \varepsilon^{n+\frac{1}{2}}_b \|_2 + \xi \| \delta_i e_t^{n+\frac{1}{2}} \|_{-1,h}^2.
\]

By using (51) again, it is clear to see that

\[
I_{1,5} \leq C (h^2 + r^4) + \xi \| \delta_i e_t^{n+\frac{1}{2}} \|_{-1,h}^2.
\]
Combining the estimates of $I_{1,i}$, $1 \leq i \leq 5$, (63) becomes
\[
\frac{\varepsilon}{2r} (\|\nabla e^{n+1}_h\|_{L^2}^2 - \|\nabla e^n_h\|_{L^2}^2) + \frac{\varepsilon}{2} (\|\nabla (e^{n+1}_h - e^n_h)\|_{L^2}^2 - \|\nabla (e^n_h - e^{n-1}_h)\|_{L^2}^2) \\
\leq C (h^{2r} + r^4 + \|\nabla e^{n+1}_h\|_{L^2}^2 + \|\nabla e^n_h\|_{L^2}^2) + \xi \|\nabla e^{n+1}_h\|_{L^2}^2 + (\phi^0_h - \phi^1_h, e^{n+1}_h, \nabla e^{n+1}_h).
\] (64)

Step 2: By taking $v_h = \varepsilon^{n+\frac{1}{2}}$ in (60) and $q_h = \varepsilon^{n+\frac{1}{2}}$ in (62), we get
\[
\frac{1}{2r} (\|\varepsilon^{n+\frac{1}{2}}_h\|_{L^2}^2 - \|\varepsilon^n_h\|_{L^2}^2) + n \|\nabla e^{n+1}_h\|_{L^2}^2 \\
= - [b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) - b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h)] - \lambda (\overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) - \gamma (\nabla \varepsilon^{n+\frac{1}{2}}) \\
+ \mu ((\nabla \times B^{n+\frac{1}{2}}) \times B^{n+\frac{1}{2}}) + \mu ((\nabla \times B^{n+\frac{1}{2}}) \times B^{n+\frac{1}{2}}) + T (\varepsilon^{n+\frac{1}{2}}_h).
\]
(65)

Now, we start to estimate the right-hand side of (65). By (21), we can rewrite $I_{2,1}$ as follows:
\[
|I_{2,1}| = \left| - b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) + b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) \\
- b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) + b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) \\
- b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) + b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) \\
- b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) + b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) \\
\right| \leq C (\|\nabla e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^n_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2}) \\
+ C (\|e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2}) \\
+ C (\|e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2}) \\
+ C (\|e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2}) \\
\leq C (h^{2r} + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2}^2 + \|\nabla e^{n+\frac{1}{2}}_h\|_{L^2}^2),
\]
where we have used (43)-(44) and the identity $b(\overline{\varepsilon^{n+\frac{1}{2}}}, \overline{\varepsilon^{n+\frac{1}{2}}}, \varepsilon^{n+\frac{1}{2}}_h) = 0$. To estimate $I_{2,2}$, we define the spatial mass average
\[
\overline{e^{n+\frac{1}{2}}_h} = \overline{|\Omega|^\frac{1}{2}(\overline{e^{n+\frac{1}{2}}}_h, 1)} = |\Omega|^\frac{1}{2} (Q_h \overline{\phi^{n+\frac{1}{2}}_h} - \overline{\phi^{n+\frac{1}{2}}_h}, 1) = |\Omega|^\frac{1}{2} (\overline{\phi^{n+\frac{1}{2}}_h} - \overline{\phi^n_h}, 1),
\]
which implies that
\[
\left| \overline{e^{n+\frac{1}{2}}_h} \right| \leq Ch^{2r+1}.
\]
Then, $I_{2,2}$ can be bounded by
\[
I_{2,2} = \lambda \left( (\overline{\phi^{n+\frac{1}{2}}_h} - Q_h \overline{\phi^{n+\frac{1}{2}}_h}) \nabla \overline{\phi^{n+\frac{1}{2}}_h} + \overline{\phi^{n+\frac{1}{2}}_h} \nabla \overline{\phi^{n+\frac{1}{2}}_h} \right) \\
+ \lambda \left( (\overline{\phi^{n+\frac{1}{2}}_h} - Q_h \overline{\phi^{n+\frac{1}{2}}_h}) \nabla \overline{\phi^{n+\frac{1}{2}}_h} + \overline{\phi^{n+\frac{1}{2}}_h} \nabla \overline{\phi^{n+\frac{1}{2}}_h} \right) \\
\leq C (\|\nabla \overline{\phi^{n+\frac{1}{2}}_h} - Q_h \nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2} + \|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2}) (\|e^{n+\frac{1}{2}}_h\|_{L^2}) \\
+ C (\|\nabla \overline{\phi^{n+\frac{1}{2}}_h} - Q_h \nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2} + \|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2}) (\|e^{n+\frac{1}{2}}_h\|_{L^2}) \\
\leq C (h^{2r} + \|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2} + \|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2}) + \frac{C}{8} (\|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2} + \|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2}) \\
\leq C (h^{2r} + \|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2} + \|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2}) + \frac{C}{8} (\|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2} + \|\nabla \overline{\phi^{n+\frac{1}{2}}_h}\|_{L^2}).
\]
where we have used (42) and the following inequality:
\[ \left| \mathbf{c}_{u}^{\alpha_{1}^{+}} \nabla \mathbf{w}_{m}^{\alpha_{2}^{+}}, \mathbf{e}_{u}^{\alpha_{1}^{+}} \right| \]
\[ = \| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}} \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}} + \| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}} \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}} \| \nabla \cdot \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}} \]
\[ \leq C(\| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + h^{2r+2}) + \frac{\eta}{16} \| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} \]

For \( I_{2,3} \), we see that
\[ I_{2,3} = \mu \left( (\nabla \times (\mathbf{B}^{\alpha_{1}^{+}} - \mathbf{B}_{h}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \right) \]
\[ + (\mathbf{v} \times (\mathbf{B}^{\alpha_{1}^{+}} - \mathbf{B}_{h}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ + (\mathbf{v} \times (\mathbf{B}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ + (\mathbf{v} \times (\mathbf{B}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ \leq \mu \left( (\nabla \times (\mathbf{B}^{\alpha_{1}^{+}} - \mathbf{B}_{h}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \right) \]
\[ + (\mathbf{v} \times (\mathbf{B}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ \leq C(h^{2r} + \| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2}) + \frac{\eta}{8} \| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} \]

where we have used the projection estimate (46) and the following inequality
\[ (\nabla \times (\mathbf{B}^{\alpha_{1}^{+}} - \mathbf{B}_{h}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ = -\mu ((\nabla \times (\mathbf{B}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ + (\mathbf{v} \times (\mathbf{B}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ \leq (\nabla \times (\mathbf{B}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ + (\mathbf{v} \times (\mathbf{B}^{\alpha_{1}^{+}})) \times \mathbf{B}_{h}^{\alpha_{1}^{+}} \]
\[ \leq C(h^{2r} + \| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2}) + \frac{\eta}{8} \| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} \]

By using Taylor expansion and projection estimate (44), the truncation error term \( I_{2,4} \) can be bounded by
\[ I_{2,4} \leq C(h^{2r} + r^{*}) + \frac{\eta}{8} \| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} \]

Combining the estimates of \( I_{2,i} \), \( 1 \leq i \leq 4 \), (65) becomes
\[ \frac{1}{2r} (\| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} - \| \mathbf{e}_{u}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \frac{\eta}{2} \| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} \]
\[ \leq C(h^{2r} + r^{*} + \| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \nabla \mathbf{e}_{u}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \| \nabla \mathbf{e}_{u}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} \]
\[ - \lambda (\| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \nabla \mathbf{e}_{u}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} \]
\[ \leq C(h^{2r} + r^{*} + \| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \| \nabla \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} + \| \nabla \mathbf{e}_{u}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} \]

Step 3: A substitution of \( I_{2} = \mathbf{w}_{m}^{\alpha_{2}^{+}} \) in (61) gives
\[ \frac{1}{2r} (\| \mathbf{e}_{u}^{\alpha_{1}^{+}} \|_{L_{2}}^{2} - \| \mathbf{e}_{u}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} \]
\[ = \mu (\| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} - \mathbf{u}_{h}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} + \| \mathbf{w}_{m}^{\alpha_{2}^{+}} \|_{L_{2}}^{2} \]
\[ \leq \sum_{i=1}^{n} I_{h,i} \]
For the right-hand side of (67), $I_{3,1}$ can be controlled by

$$I_{3,1} = \mu \left[ (\nabla B^\perp \times \bar{B}^\perp - \Pi_B \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}) + (\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}) + (\bar{e}_B^{n+\frac{1}{2}} \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}) \right]$$

$$+ \left[ (\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}) + (\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}) + (\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}) \right]$$

$$\leq \mu \left[ \|\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}\| + \|\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}\| + \|\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}\| \right]$$

$$+ C \left[ \|\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}\| + \|\nabla B^\perp \times \bar{B}^\perp \times \nabla \times \bar{e}_B^{n+\frac{1}{2}}\| \right]$$

$$\leq C(h^{2r} + \|\bar{e}_B^{n+\frac{1}{2}}\|_2^2) + \frac{\sigma_1}{12} \|\nabla \times \bar{e}_B^{n+\frac{1}{2}}\|_2^2 \quad \text{(here use (43)-(44)).}$$

By using Taylor expansions again, we further get

$$I_{3,2} \leq C(h^{2r} + r^4 + \|\bar{e}_B^{n+\frac{1}{2}}\|_2^2) + \frac{\sigma_1}{4} \|\nabla \times \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \frac{\sigma_1}{4} \|\nabla \cdot \bar{e}_B^{n+\frac{1}{2}}\|_2^2.$$

Combining the estimates of $I_{3,1}$ and $I_{3,2}$, (67) becomes

$$\frac{\mu}{2} \left( \|\bar{e}_B^{n+1}\|_2^2 - \|\bar{e}_B^n\|_2^2 \right) + \frac{\sigma_1}{2} \|\nabla \times \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \frac{3\sigma_1}{4} \|\nabla \cdot \bar{e}_B^{n+\frac{1}{2}}\|_2^2$$

$$\leq C(h^{2r} + r^4 + \|\bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2) + \mu \left( \|\bar{e}_B^{n+\frac{1}{2}} - \bar{B}_h \|_2^2 \right) + \frac{\sigma_1}{4} \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 \leq C(h^{2r} + r^4 + \|\bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 \right).$$

(68)

**Step 4:** Finally, a summation of (64), (66) and (68) gives

$$\frac{\lambda e}{8\tau} \left( \|\nabla \bar{e}_B^{n+1}\|_2^2 - \|\nabla \bar{e}_B^n\|_2^2 \right) + \frac{\lambda e}{8\tau} \left( \|\nabla \bar{e}_B^{n+\frac{1}{2}} - e_0\|_2^2 \right) + \frac{\lambda e}{8\tau} \left( \|\nabla \bar{e}_B^{n+\frac{1}{2}} - \bar{B}_h \|_2^2 \right) + \frac{\mu}{2 \tau} \left( \|\bar{e}_B^{n+\frac{1}{2}} - e_0\|_2^2 \right) + \frac{\mu}{2 \tau} \left( \|\bar{e}_B^{n+\frac{1}{2}} - \bar{B}_h \|_2^2 \right)$$

$$+ \frac{\lambda e}{2} \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \frac{\sigma_1}{2} \|\nabla \times \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \frac{3\sigma_1}{4} \|\nabla \cdot \bar{e}_B^{n+\frac{1}{2}}\|_2^2$$

$$\leq C(h^{2r} + r^4 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2 + \|\nabla \bar{e}_B^{n+\frac{1}{2}}\|_2^2) + \zeta \|\delta \epsilon^{n+\frac{1}{2}}\|_2^2,$$

(69)

where $\zeta$ is an arbitrarily small positive constant. To complete the estimate of (69), it remains to analyze $\|\delta \epsilon^{n+\frac{1}{2}}\|_2^2$. To this end, we choose $\delta \epsilon = T \delta \epsilon^{n+\frac{1}{2}}$ in (58) and get

$$\|\delta \epsilon^{n+\frac{1}{2}}\|_2^2 = \|\delta \epsilon^{n+\frac{1}{2}}\|_2^2 = \left( \|\delta \epsilon^{n+\frac{1}{2}}\|_2^2 \right)$$

$$= \left( \|\delta \epsilon^{n+\frac{1}{2}}\|_2^2 \right) = \left( \|\delta \epsilon^{n+\frac{1}{2}}\|_2^2 \right) = \zeta \|\delta \epsilon^{n+\frac{1}{2}}\|_2^2.$$

(70)

Similarly, we define

$$\frac{T \delta \epsilon^{n+\frac{1}{2}}}{|L|} = |Omega|^{-1} \left( T \delta \epsilon^{n+\frac{1}{2}} - 1 \right),$$

12
and get \( \| T_h \delta_\theta e_\phi^{n+\frac{1}{2}} - T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2} \leq C \| \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2} \). Then it is easy to derive

\[
I_{4,1} = ((\phi^{n+\frac{1}{2}} - \phi^n) e^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \times (T_h \delta_\theta e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}})
\]

\[
\leq \| (\phi^{n+\frac{1}{2}} - \phi^n) e^{n+\frac{1}{2}} \|_{L^2} \| T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}
\]

\[
+ \| (\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \times (T_h \delta_\theta e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \|_{L^2}
\]

\[
+ \| (T_h \delta_\theta e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \times (T_h \delta_\theta e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \|_{L^2}
\]

\[
\leq C(h^{2r+2} + \| \nabla e_\phi^{n+\frac{1}{2}} \|_{L^2} + \| \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}) + \frac{1}{4} \| \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}^2,
\]

where we have used integration by parts, \( \nabla \cdot u = 0 \), and

\[
\| (\nabla e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \|_{L^2}^2
\]

\[
= \| (\nabla (T_h \delta_\theta e_\phi^{n+\frac{1}{2}} - T_h \delta_\theta e_\phi^{n+\frac{1}{2}})) \|_{L^2}^2
\]

\[
= \| (\nabla \cdot (\nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) - T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \|_{L^2}^2
\]

\[
= \| (\nabla e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \times (T_h \delta_\theta e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \|_{L^2}^2
\]

\[
= \| (\nabla e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \times (T_h \delta_\theta e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}) \|_{L^2}^2
\]

Meanwhile, the estimate of \( I_{4,2} \) is straightforward:

\[
I_{4,2} \leq C \| \nabla e_\phi^{n+\frac{1}{2}} \|_{L^2}^2 + \frac{1}{4} \| \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}^2.
\]

In view of the truncation error term \( I_{4,3} \), we see that

\[
I_{4,3} = (\delta_\theta Q_\phi e_\phi^{n+\frac{1}{2}} - \delta_\theta Q_\phi e_\phi^{n+\frac{1}{2}} - T_h \delta_\theta e_\phi^{n+\frac{1}{2}})
\]

\[
+ \varepsilon (\nabla (\nabla e_\phi^{n+\frac{1}{2}} + \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}}), T_h \delta_\theta e_\phi^{n+\frac{1}{2}})
\]

\[
= (h^{2r} + \frac{1}{4} \| \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}^2).
\]

Combining the estimates of \( I_{4,i} \), \( 1 \leq i \leq 3 \), as well as the identity that \( \| \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}^2 = \| \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}^2 \), we obtain the following result from (70):

\[
\| \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}^2 \leq C(h^{2r} + \frac{1}{4} \| \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}^2 + \| \nabla \nabla e^{n+\frac{1}{2}} \|_{L^2}^2 + \| \nabla T_h \delta_\theta e_\phi^{n+\frac{1}{2}} \|_{L^2}^2).
\]
By using the discrete Gronwall inequality, there exists a positive constant $\tau_0$ such that when $\tau < \tau_0$, 
\[
\|\nabla \phi^{n+1}\|_2^2 + \|\nabla u^{n+1}\|_2^2 + \|\nabla w^{n+1}\|_2^2 \\
+ \sum_{m=1}^{N} (\|\nabla \phi_m^{n+1}\|_2^2 + \|\nabla u_m^{n+1}\|_2^2 + \|\nabla w^{n+1}\|_2^2 + \|\nabla w_m^{n+1}\|_2^2) \\
\leq C(h^2 + \tau^4). 
\] 
(73)

An application of the triangle inequality, combined with projection estimates (42), (44) and (46), finally leads to the error estimates (29)–(30). This completes the proof of Theorem 3.1. \(\square\)

5. Numerical examples

5.1. Convergence test

In this subsection we test the convergence order of the proposed numerical scheme. For simplicity, a two-dimensional domain $\Omega = (0, 2\pi)^2$ is taken and all the physical parameters are set to be 1, i.e. $\epsilon = \lambda = \sigma = \mu = 1$. The final time is given by $T = 0.5$. In addition, we adopt the linear element for $p$ and the quadratic element for $\phi$, $w$, $u$, $B$. The exact solution is formulated as
\[
\phi = -t^8 \cos x \cos y, \\
w = -t^8 \cos x \cos y, \\
u = \begin{cases} 
-t^8 \sin^2 x \sin(2y) \\
t^8 \sin(2x) \sin^2 y,
\end{cases} \\
B = \begin{cases} 
-t^8 \sin y \cos x \\
t^8 \sin x \cos y,
\end{cases} \\
p = t^8 \sin x \sin y.
\]

We denote the numerical errors as
\[
\mathcal{E}(\nabla \phi) = \|\nabla(\phi^N - \phi_h^N)\|_2, \\
\mathcal{E}(u) = \|u^N - u_h^N\|_2, \\
\mathcal{E}(B) = \|B^N - B_h^N\|_2, \\
\mathcal{E}(\nabla w) = \sum_{m=1}^{N-1} \|\nabla(\nabla w_m^{n+1} - \nabla w_h^{n+1})\|_2, \\
\mathcal{E}(\nabla u) = \sum_{m=1}^{N-1} \|\nabla(\nabla w_m^{n+1} - \nabla w_h^{n+1})\|_2, \\
\mathcal{E}(\nabla \times B) = \sum_{m=1}^{N-1} \|\nabla \times(\nabla w_m^{n+1} - \nabla w_h^{n+1})\|_2.
\]

To investigate the temporal convergence rate, we choose the spatial size $h$ sufficiently small. For $h = 2\pi/120$ and $\tau = 1/18, 1/36, 1/54, 1/72$, the numerical errors between the exact solution and numerical solution generated by scheme (24)–(28) are displayed in Table 1. The numerical results demonstrate that the temporal convergence rate of the proposed scheme is of $O(\tau^2)$, which is consistent with the theoretical analysis.

For the spatial convergence, we still adopt the exact solutions (74) and take the time step size as $\tau = 1/1200$ so that the temporal numerical error becomes negligible. The spatial mesh sizes are chosen as $h = 2\pi/20, 2\pi/40, 2\pi/60, 2\pi/80$ and the numerical results are displayed in Table 2. Clearly, the spatial convergence of $\phi$ and $w$ in $H^1$ semi-norm is $O(h^2)$, which is consistent with the theoretical results given in Theorem 3.1. From Table 2, the spatial convergence of $u$ and $B$ in $L^2$ norm is shown to be $O(h^3)$ (one order higher than the theoretical results given in Theorem 3.1), which is still challenging to prove and its analysis will be considered in future works.

We also implement this numerical example by using the same time step sizes and spatial mesh sizes as above except for the parameter $\epsilon$, for which we choose to be 0.1. Numerical results are shown in Tables 3 and 4, and the results indicate the order of accuracy as well.
5.2. Energy stability test

In this subsection we investigate the energy dissipation property of the numerical scheme (24)–(28). Similarly, the quadratic element is adopted for $\phi, w, u, B$, and the linear element is used for $p$. The spatial resolution and the time step size are taken as $h = 2\pi/20$ and $\tau = 0.1$, respectively. The initial data are set to be

\[
\begin{align*}
\phi_0 &= -\cos x \cos y, \\
w_0 &= -\cos x \cos y, \\
u_0 &= \begin{pmatrix} \sin^2 x \sin(2y) \\
-\sin(2x) \sin^2 y \end{pmatrix}, \\
B_0 &= \begin{pmatrix} -\sin y \cos x \\
\sin x \cos y \end{pmatrix}, \\
p_0 &= \sin x \sin y.
\end{align*}
\]

Then we compute the discrete energy (33) up to final time $T = 10$, and the energy evolution curve is displayed in Fig. 1, where the dissipation for the discrete energy (33) could be clearly observed.

6. Conclusion

In this paper, we propose and analyze a temporally second-order accurate, mixed finite element numerical method for the Cahn–Hilliard–Magnetohydrodynamic system (6)–(10). The primary difficulties are associated with the coupled nature

</table>
of the fluid motion, electric field, and phase evolution. The nonlinearity of the free energy in the phase field makes the system even more challenging. In the proposed numerical scheme, a modified Crank–Nicolson approximation is applied to the phase field and the free energy, combined with a second-order explicit extrapolation for the concave part. Such a numerical approximation ensures energy stability and unique solvability for the phase field. In addition, second-order semi-implicit treatments are used for other coupled parts in the system. As a result, the discrete mass conservation, unique solvability, and energy stability have been theoretically established for the numerical scheme. The numerical simulations and corresponding theoretical analyses of the Cahn–Hilliard–Magnetohydrodynamics model with $\varepsilon \ll 1$ and $\mu \ll 1$ are challenging and interesting, and will be considered in future works.
